

## IN THE UNITED STATES PATENT & TRADEMARK OFFICE BEFORE THE BOARD OF PATENT APPEALS AND INTERFERENCES

Applicant: Anders Jonsson

Examiner: Glenn F. Myers

Title: Rotator

Group Art Unit: 3652

Serial No.: 10/502,017

Filed: December 17, 2004

**Commissioner for Patents** 

P.O. Box 1450

Alexandria, VA 22313-1450

Mail Stop: Appeal Briefs, Patents

## **REPLY BRIEF**

This Reply Brief is being filed in response to the Examiner's Answer, mailed on January 4, 2011, in connection with the pending appeal of the above identified patent application.

I hereby certify that this correspondence is being deposited with the United States Postal Service as first class mail in an envelope addressed to Commissioner for Patents, P.O. Box 1450, Alexandria, VA 22313-1450, on the date indicated below.

Reg. No. 27,954

Starting at page 10, paragraph 33 and continuing onto page 11 of the Examiner's Answer, the Examiner addresses the arguments advanced in Applicant's Appeal Brief filed on October 14, 2010.

Starting at the first line of paragraph 33 of the Examiner's Answer and continuing onto page 11, line 2, the Examiner argues that the <u>Dessaux</u> patent discloses a relative position sensor for determining the relative position of rotation between a rotor and a stator. However, Applicant has already conceded that the <u>Dessaux</u> patent discloses position sensors (Applicant's Appeal Brief, page 7).

The thrust of Applicant's argument in the Appeal Brief is that although the <u>Dessaux</u> patent discloses position sensors, it fails to teach or suggest any means for limiting the extent of rotation between a rotor and a stator, based upon a determined value of the relative position of the rotor and the stator, for limiting twisting of attached hoses and/or cables. (Applicant's Appeal Brief, pages 7-8).

The Examiner's Answer refers to column 1, lines 41 – 47 of the <u>Dessaux</u> Specification as referring to "... protection against risk of shearing and deterioration of the feed and remote control cable in event the lifting cables become twisted". However, this portion of the <u>Dessaux</u> Specification has been addressed in Applicant's Appeal Brief, pages 7 – 8. More specifically, the portion of the <u>Dessaux</u> Specification quoted in the Examiner's Answer refers to background

prior art discussed in the <u>Dessaux</u> Specification and not to the invention <u>Dessaux</u> patent itself. Moreover, the quoted portion refers to protection against the risk of shearing and deterioration of the feed and remote control cable <u>in event the lifting cables become twisted</u> (emphasis added). Thus, no positive means for preventing the twisting of the cables is provided, and protection against shearing and deterioration of the feed and remote control cable is provided only <u>after</u> the cables have already become twisted.

Contrary to this disclosure in the <u>Dessaux</u> Specification, the method and apparatus disclosed by Applicant and defined by independent claims 1 and 9 provide positive protection against shearing and twisting of cables and hoses <u>before</u> the cables and hoses become twisted by limiting the extent of rotation of the rotor relative to the stator based upon the determined relative position of rotation between the rotor and the stator. The <u>Dessaux</u> patent fails to provide any means for limiting the extent of rotation of a rotor relative to a stator based upon the relative position determined by a position sensor.

At page 11, lines 7-8 of the Examiner's Answer, the Examiner refers to Figure 2 of the <a href="Dessaux">Dessaux</a> drawing as showing that cables 25, 27, 26 and 28 are not twisted. However, neither Figure 2 of the drawing or the <a href="Dessaux">Dessaux</a> Specification disclose that the cables illustrated in Figure 2 of the drawing are not twisted as a result of positively limiting the extent of rotation of a rotor relative to a stator, based upon a relative position determined by a position sensor, as disclosed by Applicant and as positively recited in independent claims 1 and 9.

For the reasons discussed herein, in the previously filed Appeal Brief, and during the prosecution of the Patent Application, Applicant respectfully submits that appealed independent claims 1 and 9 are allowable over the prior art applied in the Final Action, and respectfully requests that the prior art rejection of the claims be reversed.

Respectfully submitted,

Mark P. Stone
